

Sea Level Rise: From Global to Local

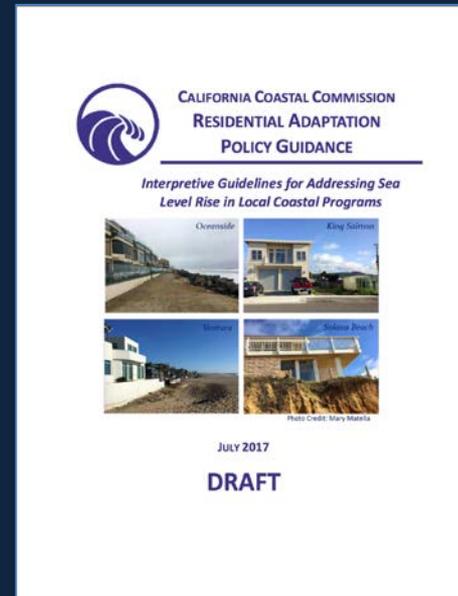

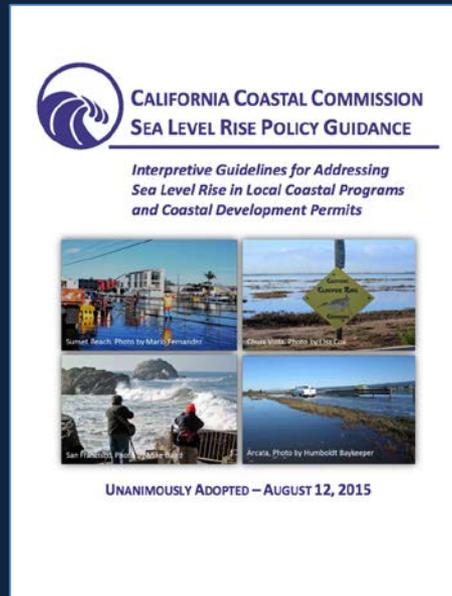

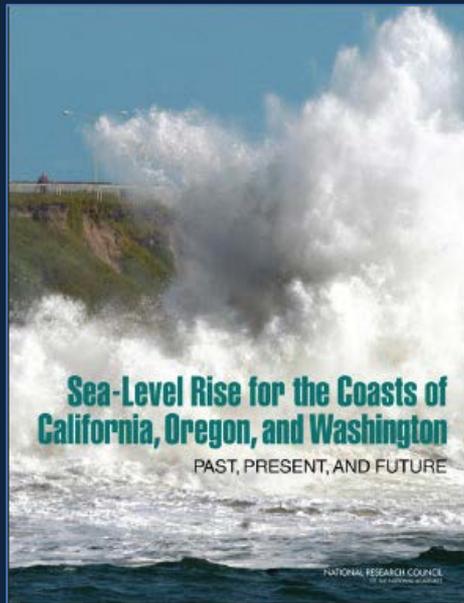

Juliette Hart, Ph.D. | Director of Outreach, USGS
Malibu City Council Presentation | Sep. 11, 2017

Global sea level rise (SLR) is accelerating

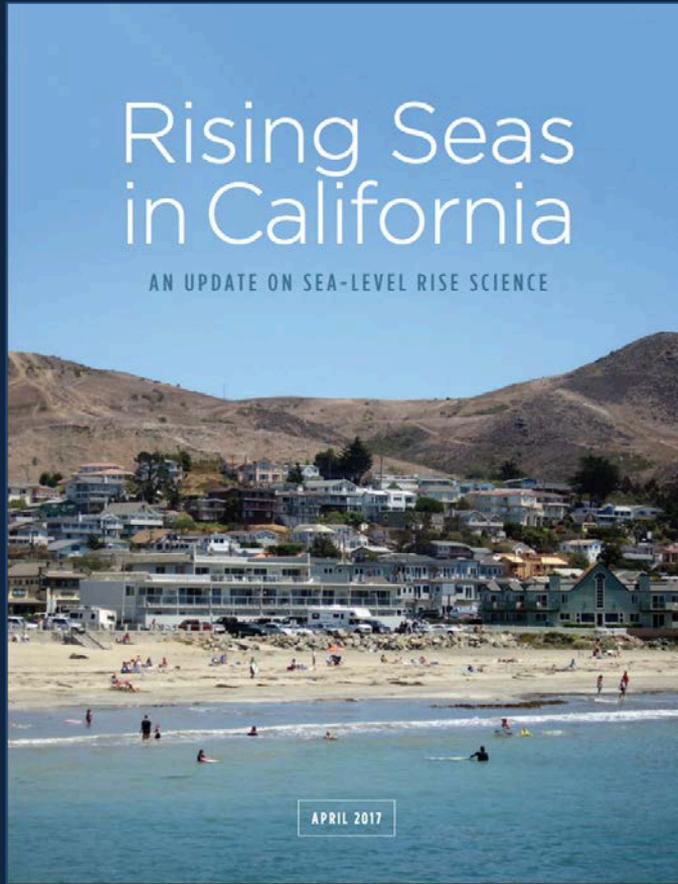

SLR in California

Time Period	Low	Mid	High
2000 - 2030	2 in	6 in	12 in
2000 – 2050	5 in	11 in	24 in
2000 – 2100	17 in	37 in	66 in

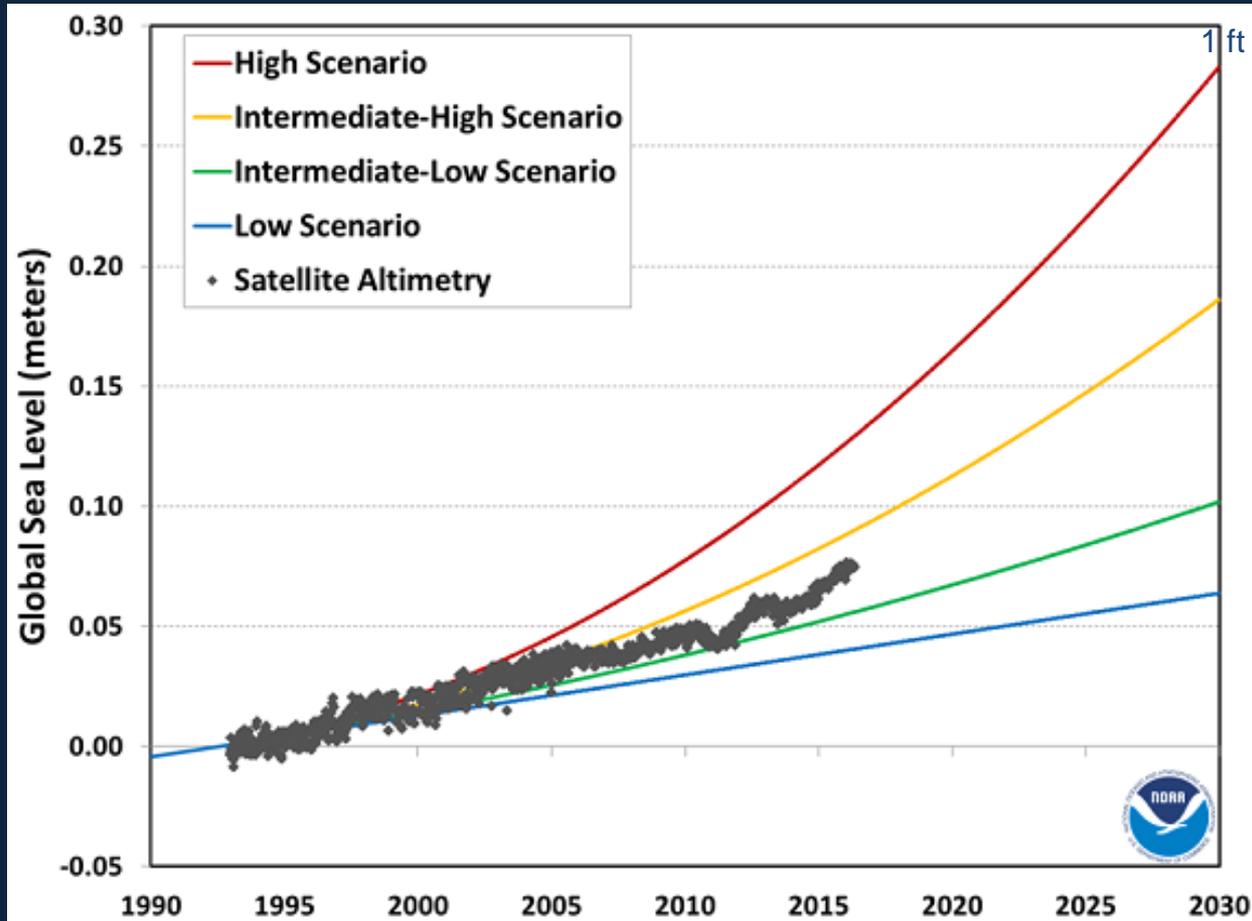

SLR in California

- Assigned probabilities for high and low GHG emission scenarios
- $H^{++} = 10 \text{ ft (120 in)}$

How are we tracking?

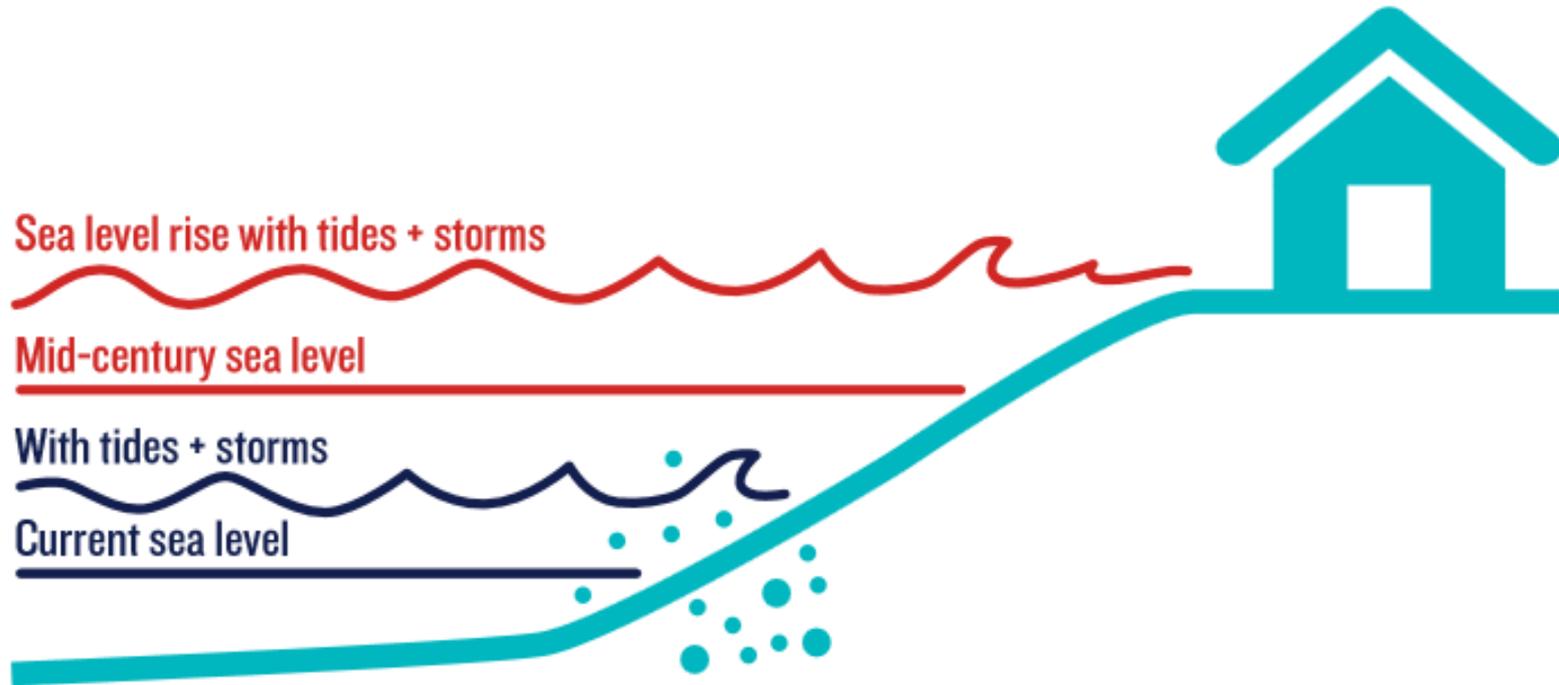

Impacts from SLR

- Accelerated beach erosion rates
- Greater incidence of cliff failures
- Landwards translation of coastal flooding & inundation
- Beach/shore safety compromised
- Saltwater intrusion into coastal aquifers
- Impacts to navigation conditions

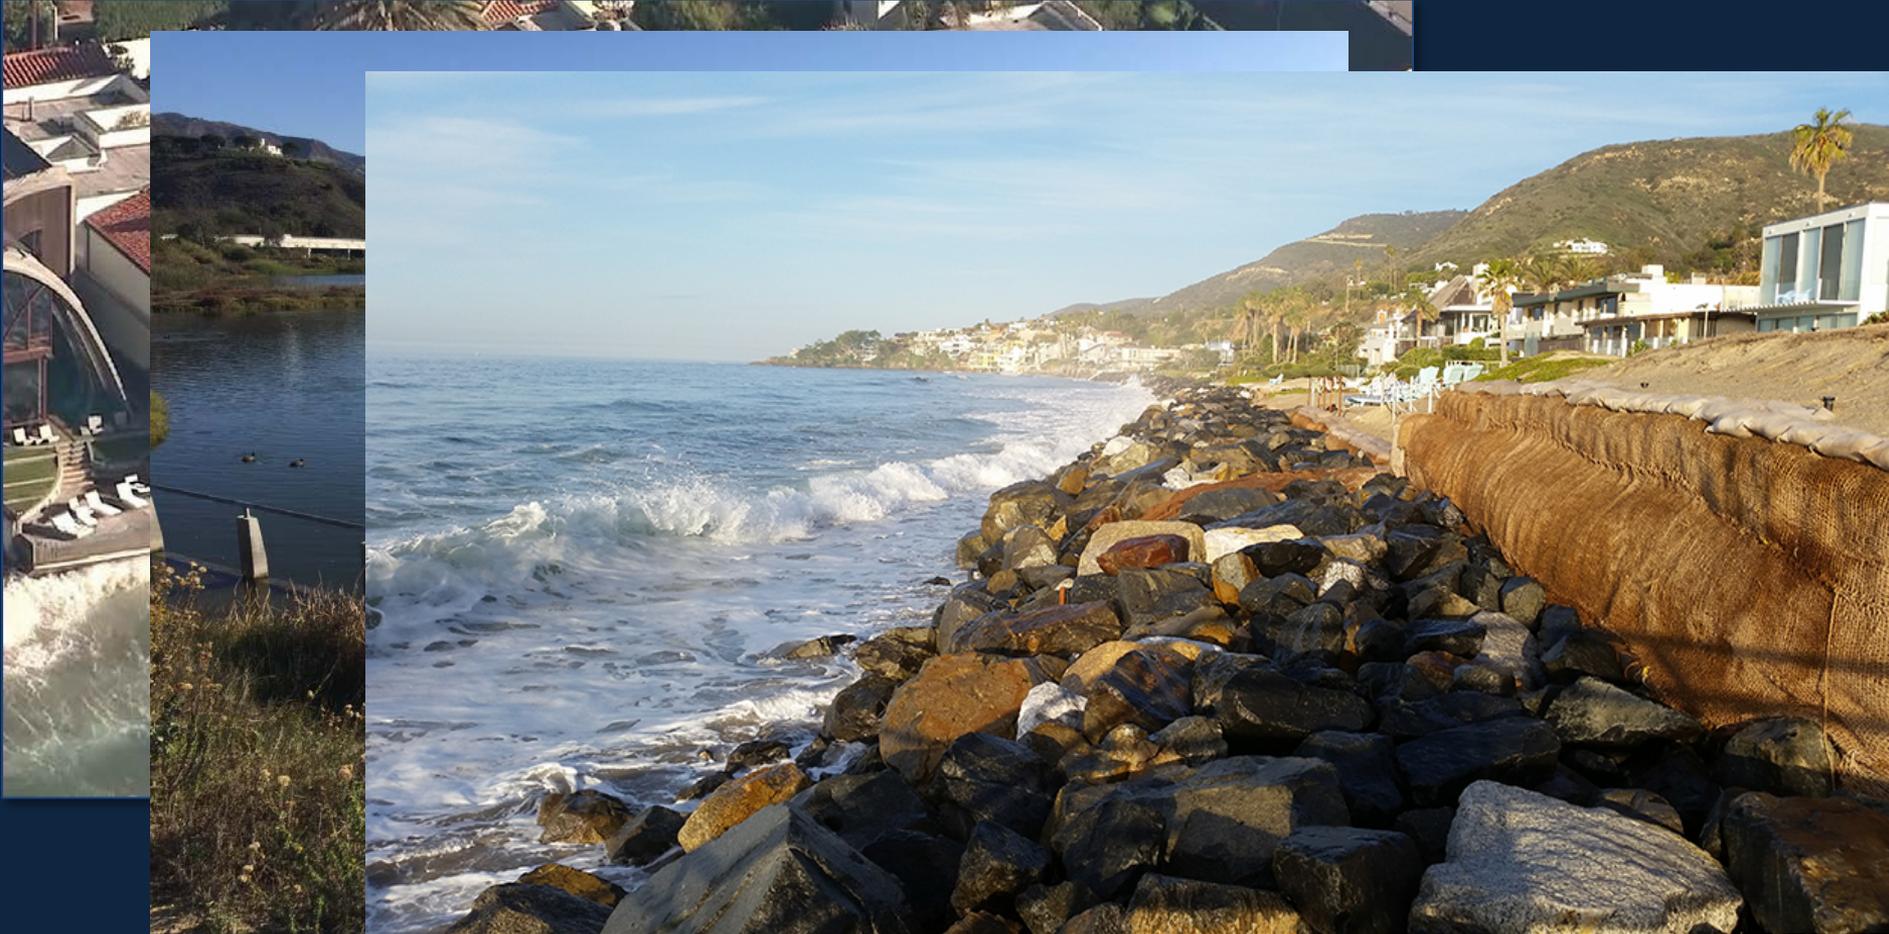

Photo Credit: Urban Tides

Beyond SLR...storms & tides

Beyond SLR...storms & tides

2015-16 El Niño

- Top 3 El Niño events since at least 1870 (1982-83 and 1997-98)
- Wave energy > 50% above the average winter, highest since 1997
- Winter erosion in So Cal – 71% greater than normal

Coastal Flooding

map help
clear
navigate

1) Choose a topic.
Flooding shows the inundation due to SLR, waves, and storm surge.

Flooding Waves
Current Duration
Flood Potential

What do the Topics represent?
 Compare Flooding Scenarios

2) Choose an Amount of Sea Level Rise (cm).
0 25 50 75 100 125
150 175 200 300 [Use Text](#)
What Sea Level Rise scenario should I use?

3) Choose an Event
Choose Storm Scenario Frequency
None Annual 20 year 100 year
Or Choose SF Bay King Tide Scenario
King Tide
What are Storm Scenarios?
What is a King Tide scenario?

4) Choose Shoreline Change (Southern California only)
 Cliffs Shoreline Position
And Choose Management Options
"Hold the Line" yes no
Beach nourishment, yes no
Turn on "Hold the Line Assumptions" below to see what influences these management options. For Shoreline Position, the yellow line indicates the landward limit of shoreline erosion. For Cliff Retreat, the black dashed line indicates where coastal armoring shows cliff retreat.

5) Choose other layers to view with topic data.
 "Hold the Line" Assumptions
 Digital Elev Model (DEM)
 Levees

20 m
100 ft

AdaptLA: Coastal Impacts Planning

Regional AdaptLA:

Coastal Impacts Planning for the Los Angeles Region

Results from the Local Coastal Program Sea Level Rise Grant Program

Executive Summary and Technical Report

Prepared by the University of Southern California Sea Grant Program

- Grant awarded to City of Santa Monica by CA Ocean Protection Council
- Project convened and led by USC Sea Grant
- Scientific information:
 - Offshore/nearshore waves from USGS
 - Coastal Hazards Analysis— Environmental Science Associates (ESA)
 - Beach position change – TerraCosta Consulting
 - Exposure Analysis by ESA

AdaptLA: Exposure Analysis – Malibu

With 3 ft SLR (by 2100)

- 13.6 miles of roadway / bikeway impacted

With 3 ft SLR + 100 yr storm (by 2100)

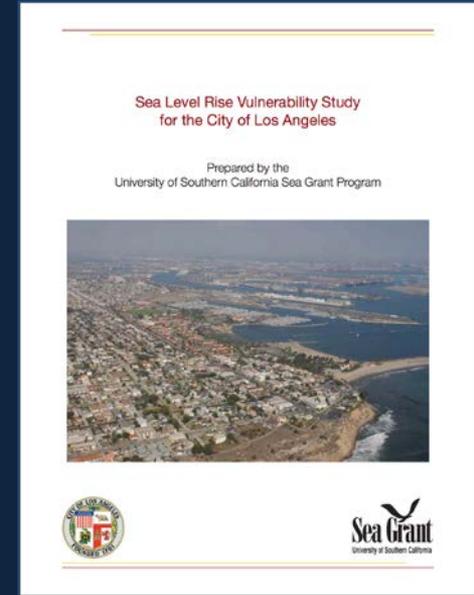

- 25.7 miles of roadway / bikeway impacted
- 1695 bldgs impacted (mainly residential)

With 5.5 ft SLR + 100 yr storm (by 2100)

- 29.6 miles of roadway / bikeway impacted
- 1916 bldgs impacted (mainly residential)

SLR Planning in L.A.

- SLR Vulnerability Assessments
 - City of LA, Santa Monica, Hermosa Beach, Port of LA, Port of LB, Long Beach
- Local Coastal Plans Updates
 - City of L.A. (Venice), Santa Monica, Hermosa Beach
- Hazard Mitigation Plan Updates
 - City of L.A., Hermosa Beach
 - Malibu...

Options for Adapting to SLR

Accommodate

- Elevate
- Setbacks

Options for Adapting to SLR

Accommodate

- Elevate
- Setbacks

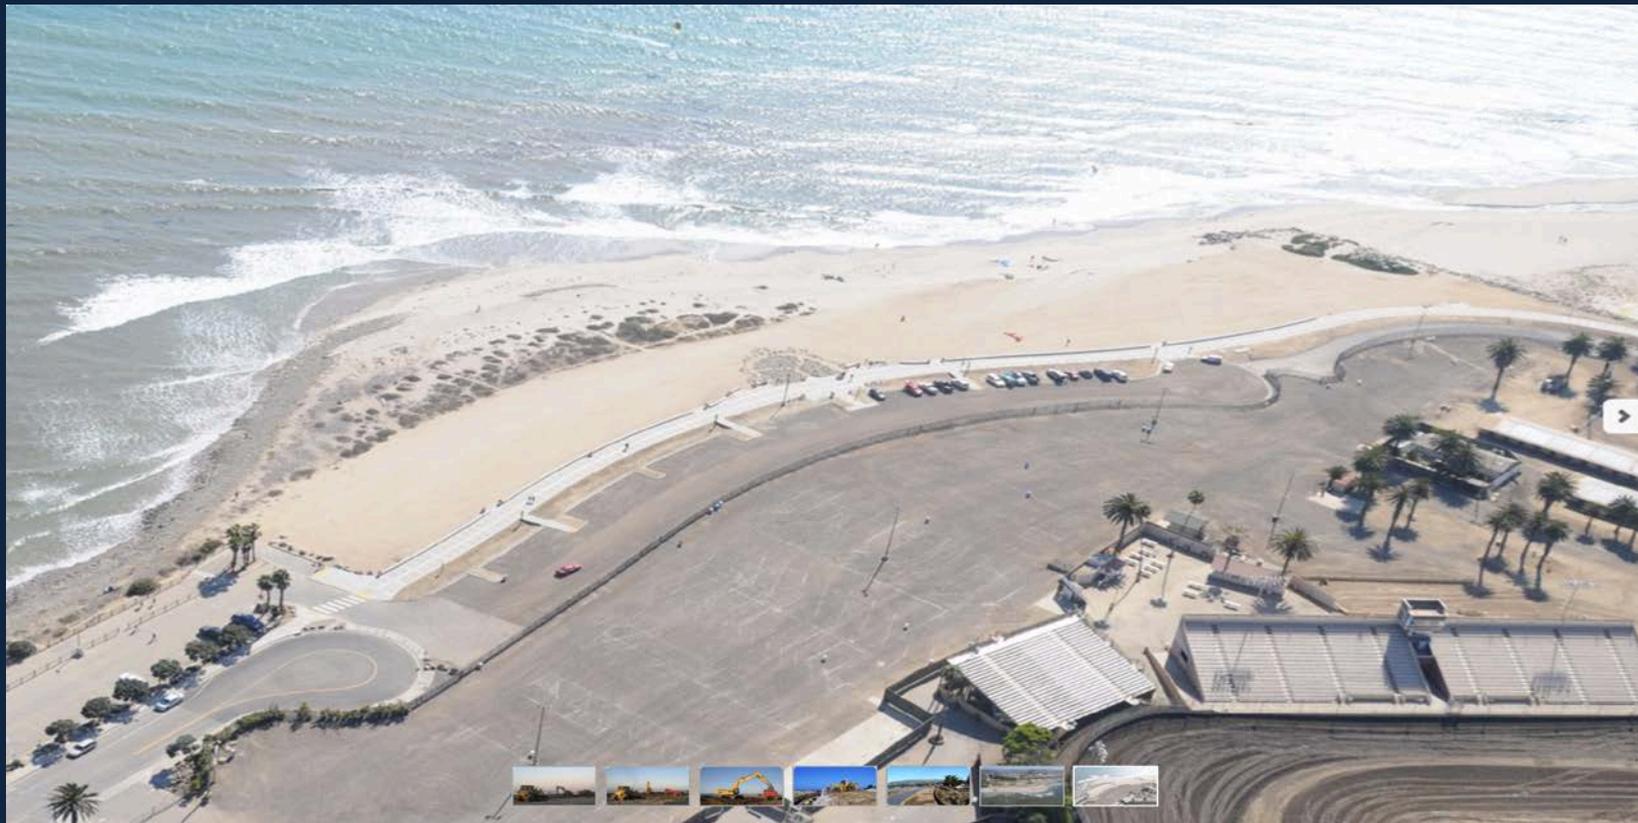

Protect

- Sediment Management
- Beach Nourishment
- Cobble Nourishment
- Seawalls and Revetments
- Breakwaters
- Jetties
- Artificial Reefs
- Perched Beaches

Legend

- Los Angeles County 2010 Shoreline
- FEMA FLOOD ZONE**
 - Flood Hazard Line
 - VE
 - X
 - 0.2 Percent Annual Flood
- CoSMoS**
 - 0ft (0cm) with 100 year storm
 - Model Run Up Points

Data Sources: USGS Coastal Storm Modeling System (CoSMoS), ESA
 Map Drafted by USC Sea Grant September 2017

0 0.08 0.16 0.24 Miles

FEMA vs. CoSMoS

	FEMA	CoSMoS
<u>Treatment of armoring</u>	Assume most armor fails	Assume “hold the line”*
<u>Storm scenarios</u>	50 year historic time series	GCM-modeled storm for 21 st Century
<u>Flood extents</u>	Wave run-up (ankles get wet)	Dynamic wave set-up (stays wet for ~2 min)
<u>Flood modeling</u>	“Empirical” model	Hydrodynamic modeling

Regional Scale

- AdaptLA: Coastal Impacts Planning for the LA Region
- California Climate Science Alliance
- Coastal Ecosystem Vulnerability Assessment (CEVA, Santa Barbara)
- LA Regional Collaborative on Climate Action and Sustainability (LARC)
- Regional Water Quality Control Board for LA and Ventura Counties
- San Diego Regional Climate Collaborative
- Southern California Coastal Water Research Project (SCCWRP)
- Wetlands Recovery Projects (San Diego - Orange County region & LA - Ventura - Santa Barbara region)

Groundwater Impacts

- Major issues
 - Inundation
 - Shallower coastal groundwater
 - Saltwater intrusion

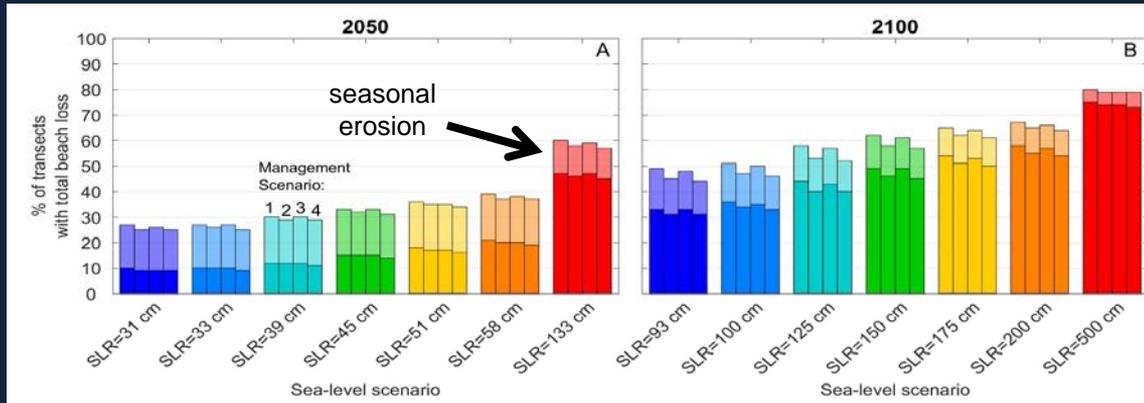

- Groundwater inundation
 - May exceed overland flooding and happen much sooner
 - Low-lying areas most vulnerable

Projected Beach Change- SoCal

- Many beaches will erode considerably (avg. = ~50 m)

- 31 to 67% of beaches completely eroded*

*Highlighted in *Los Angeles Times*, *Orange County Register*, *Scientific American*, *Hans India*, etc.

Long-term Cliff Retreat

- Uses an ensemble of up to 6 cliff models per transect
 - Beach protects cliff from waves
 - Includes water level variations (tides, run-up, set-up, surge, etc.)
- Synthesized from models in scientific literature (with several improvements)
- Uses machine learning (Artificial Neural Networks) to estimate model coefficients and extrapolate model behavior over study area

Flood Map Uncertainty (“potential”) Generated by raising and lowering flood elevation data by

Model uncertainty
(*rms* = 0.12 m, at tide stations)
Area and number of storms
validated against are small
compared to the geographic extent
of the study area and thus model

Vertical accuracy of DEM
(*rms* = 0.18 m in open
terrain) (Dewberry 2012)

Vertical land motion
Spatially variable based on
GPS data and statistical and
physical tectonic models
(Howell et al., 2016)

Future Conditions

Coastal Storms for California

- No significant changes in wave height
- Extreme events approach from ~10-15 degrees further south

El Niño for 21st Century

- More frequent extreme events
- Doubling of winter erosion
- Wave energy increase by 30%

Net effect

- Today's 100-year coastal water level event is projected to occur every 1-5 years by 2050 for much of California
- Greatest impacts on low-lying coastal areas
